### **Project Description**

- Describe the project
- Functionalities
- Libraries - sound/animation
- Additional elements

This two player game starts with the players being able to choose their character design. The game works by having each character throw a boomerang which will be able to come back given the condition that there is not a wall between the player and the boomerang. The objective of the game is to have the character “kill” their opponent by successfully throwing a boomerang at them. A boomerang will return back to the player each time they throw it, unless the path back to the player is blocked, which in that case they will have to go pick it up. Each character will have 3 lives throughout the game. There will be multiple maps and rounds as the level progresses and will end when one player fully dies by losing all three lives.

We plan on using the processing libraries for sound and animations so that there will also be sounds and animations for different actions like when the player dies and throws the boomerang. In addition, to add additional elements to the game we will design the levels with different components, such as having a maze level and one with holes in the ground.

### **How does it work?**

- Ex. instructions for which keys to use, how to play the game, game objective

The game will open with the characters being able to choose which player design they will like. Player 1 uses the arrow keys to move their character, while Player 2 uses “WASD” keys to move. Double clicking the up arrow key and the “W” key will allow the players to throw their boomerang. If the boomerang cannot go back to the player because an obstacle is in the way, the boomerang will stop in its path. The player needs to walk back towards it, and once they are near it, they pick it up automatically. Players must stay on the map (ex. avoid holes in the ground). If a player is hit by the other’s boomerang, they lose a life and their hearts will decrease (displayed on-screen). Once a player loses a life, the map changes, and the players restart.
